Yearbook Notes

- 
- This Yearbook presents a summary of the rainfall and water level data observed and recorded by the telemetry system of the PRFFWC in year 2017.
 - The supervisory terminal of the PRFFWC system is the main data series considered for database buildup.
 - The main source for complementing breaks / gaps in the supervisory terminal data series are the telemetry stations' data loggers that is if the data exist.
 - No attempts were made to fill-in gaps and breaks in the data series when there are no data available in the loggers except only those with relatively short gap periods.
 - For short WL gaps a simple eye-fit method is normally carried-out.
 - Obvious and / or suspected erroneous data were directly deleted from the data series. However, these were done after doing some data consistency check, reference from field survey reports, and / or field station instrument problem validation.
 - All data at the start of analyses were treated as valid information; no statistical analysis can replace actual observation unless there are known inconsistencies in the means of measurements, in the measuring instrument / equipment itself, etc.
 - For further information and clarification on the general buildup of the PRFFWC data series please send a message to e-mail address: prffwc@gmail.com

Scope and Limitations

1. This Data Yearbook presents the hydrological data summary of the 17 rainfall stations and 9 water level stations of the PRFFWC for the year 2017 (Mayapyap RR-WL is out-of-order)
2. The rainfall dataset in this report covers the period starting from the past 1-hour observation ending at 0900H (LST) of 01 January 2017 until the last 1-hour observation ending at 0800H (LST) of 01 January 2018; Accordingly, it follows that a 24-hour daily total (or average) starts at 0801H of the present day and ends at 0800H of the following day; Water level data series are reported in instantaneous observed value as to its specific time but the average value is taken using the same average reporting time period as in the rainfall.
3. The shortest time period considered in this summary report is 1 hour.
4. Units for some of the hydrological elements:
 - a. Rainfall – millimeters (mm)
 - b. Water Level (River Stage) – meters (m)
 - c. Cross-sectional area – square meter (m^2)
 - d. River Discharge – cubic meters per second or cumecs (m^3/sec)
 - e. Rainfall day – rain-days
5. The minimum rainfall amount for telemetry stations is 1 mm; for the rainfall observations in PRFFWC in the City of San Fernando (PRFFWC-CSFP), Pampanga, the minimum is 0.25 mm;
6. Rain-day is considered as a day with at least 1 mm of rainfall for telemetry stations; and at least 0.25 mm for PRFFWC-CSFP station;
7. The hydrological data summary presented in this yearbook are the daily rainfall observations, monthly rainfall and average, maximum rainfall total of various periods, and total rain-days per month; the daily water level averages, maximum stage for each month and other regular information that were extracted from the available data series of each station.
8. For the daily rainfall presentation table, yellow shaded cell indicates rainfall values between 1 to 60 mm for telemetry stations (0.25 to 60.0 for PRFFWC-CSFP station); pink shade cells from 61 to 180 mm (60.25 to 180.0 for PRFFWC-CSFP station); light-red shade cells for values greater than 180 mm. Likewise, for water level summary, cell shades are in a graded color scale from a white shade to a regular semi-orange shade that is relative to an increase in water level values. Thus, a “0.00” value (minimum) is white and maximum value within the table will be orange shaded. In the summary below the daily value tables (the daily rainfall and in the average daily water level tables) a green shaded cell indicates the maximum value in their respective rows.

Disclaimer: The dataset summary presented herein have been processed and validated through several steps using the best possible means available to the PRFFWC at the time of processing. However, still it is possible that results may contain inadvertent errors such as typographical in nature, errors resulting from possible misuse of excel formulae, and other similar factors. The summary information in this yearbook report may be revised as new analyses emerge.

Users noting any errors that they may have encountered in this report are requested to inform the PRFFWC. Furthermore, users may use the information contained herein at their own risk.

Data Series Issues of 2017

1. January: Mayapyap RR-WL totally down and out for the whole year; San Isidro & Mexico WL are zero for the whole month.
2. February: San Isidro WL is zero for the whole month.
3. March: San Isidro WL is zero for the whole month; Candaba WL sensor was pulled-out 1300H, 10 due to bridge repairs at the station's measuring section.
4. April: San Isidro & Peñaranda WL are zero for the whole month.
5. May: San Isidro WL is zero for the whole month; San Rafael RR is zero for whole month (doubtful).
6. June: San Isidro WL is zero for the whole month.
7. July: San Isidro WL is zero for the whole month.
8. August: Data from stations that were reporting during the month looks acceptable.
9. September: Data from stations that were reporting during the month looks acceptable.
10. October: San Isidro WL is zero for the whole month. Candaba WL reinstalled in one of the station's concrete foundation posts on 1500H, 13. Candaba WL supervisory is higher by an estimated 0.30 meters than SG at reinstallation (all supervisory readings starting 1500H, 13 adjusted by -0.30 meters)
11. November: Candaba WL gauge is less than 0.30 m from supervisory data as validated by picture; adjusted supervisory by -0.30 m; all values at 2.85 or a little less than that for a relatively long period have been deleted from the data series as these were deemed erroneous data.
12. December: Candaba WL adjusted by -0.30 m; all values below 2.85 or a little less than that for a relatively long period have been deleted from the data series.

The maximum monthly total values for some stations may be smaller than their 480 hours (20 days) of sliding time total. This means that the 20-day total transcends 2 adjacent months. Likewise, the 24-hour unrestricted sliding time period will be much larger than the meteorological day (fixed 8am to 8am) total.

Above table are still the latest information for PRFFWC streamgaging sites. Rating curve equations remains the latest available for now. The RCs should be updated regularly.
