Yearbook Notes

- 
- This report presents a summary of the rainfall and water level data observed and recorded by the telemetry system of the PRFFWC in year 2018.
 - The supervisory terminal of the PRFFWC system is the main data series considered for the database buildup.
 - The main source for complementing breaks / gaps in the supervisory terminal data series are the telemetry stations' data loggers that is if data exist in the latter.
 - No attempts were made to fill-in gaps and breaks in the data series when there are no data available in the loggers except only those with relatively short gap periods.
 - For short WL gaps a simple eye-fit method is normally carried-out.
 - Obvious and / or suspected erroneous data were directly deleted from the data series however, these were done after doing some data consistency check, field survey, and / or field station instrument problem validation.
 - All data at the start of analyses were treated as valid information; no statistical analysis can replace actual observation unless there are known inconsistencies in the means of measurements, in the measuring instrument / equipment itself, etc.
 - Further information and clarification on the general buildup of the PRFFWC data series please e-mail us at: prffwc@gmail.com

Scope and Limitations

1. This Data Yearbook presents the hydrological data summary of the 17 rainfall stations and 9 water level stations of the PRFFWC for the year 2018 (Mayapyap RR-WL remains out-of-order)
2. The rainfall dataset in this report covers the period starting from the past 1-hour observation ending at 0900H (LST) of 01 January 2018 until the last 1-hour observation ending at 0800H (LST) of 01 January 2019; Accordingly, it follows that a 24-hour daily total (or average) starts at 0801H of the present day and ends at 0800H of the following day; Water level data series are reported in instantaneous observed value as to its specific time but the average value is taken using the same average reporting time period as in the rainfall.
3. The shortest time period considered in this summary report is 1 hour.
4. Units for some of the hydrological elements:
 - a. Rainfall – millimeters (mm)
 - b. Water Level (River Stage) – meters (m)
 - c. Cross-sectional area – square meter (m^2)
 - d. River Discharge – cubic meters per second or cumecs (m^3/sec)
 - e. Rainfall day – rain-days
5. The minimum rainfall amount for telemetry stations is 1 mm; for the rainfall observations in PRFFWC in the City of San Fernando (PRFFWC-CSFP), Pampanga, the minimum is 0.25 mm;
6. Rain-day is considered as a day with at least 1 mm of rainfall for telemetry stations; and at least 0.25 mm for PRFFWC-CSFP station;
7. The hydrological data summary presented in this yearbook are the daily rainfall observations, monthly rainfall and average, maximum rainfall total of various periods, and total rain-days per month; the daily water level averages, maximum stage for each month and other regular information that were extracted from the available data series of each station.
8. For the daily rainfall presentation table, yellow shaded cell indicates rainfall values between 1 to 60 mm for telemetry stations (0.25 to 60.0 for PRFFWC-CSFP station); pink shade cells from 61 to 180 mm (60.25 to 180.0 for PRFFWC-CSFP station); light-red shade cells for values greater than 180 mm. Likewise, for water level summary, cell shades are in a graded color scale from a white shade to a regular semi-orange shade that is relative to an increase in water level values. Thus, a “0.00” value (minimum) is white and maximum value within the table will be orange shaded. In the summary below the daily value tables (the daily rainfall and in the average daily water level tables) a green shaded cell indicates the maximum value in their respective rows.

Disclaimer: The dataset summary presented herein have been processed and validated through several steps using the best possible means available to the PRFFWC at the time of processing. However, still it is possible that results may contain inadvertent errors such as typographical in nature, errors resulting from possible misuse of excel formulae, and other similar factors. The summary information in this yearbook report may be revised as new analyses emerge.

Users noting any errors that they may have encountered in this report are requested to inform the PRFFWC. Furthermore, users may use the information contained herein at their own risk.

Data Series Issues of 2018

1. January: All data of Candaba WL supervisory adjusted by -0.30 meters and all WL falling somewhere at 2.85 and / or a little bit below for a substantially long period of time were deleted from the data series for the whole year (these are erroneous data); Sasmuan WL was adjusted by -1.0 meters (1800H, 05 to 2000H, 06) as reading seems to be out of sync; San Isidro WL is zero for the whole month.
2. February: Peñaranda & San Isidro WL are all zero for the month; Sasmuan WL supervisory data started 1100H, 21 and all other gaps filled by logger's data, and some were eye-fitted as data seems erratic.
3. March: Peñaranda & San Isidro WL are all zero for the month; several data points of Sasmuan WL were adjusted.
4. April: Sapang Buho, Peñaranda & San Isidro WL are all zero for the month.
5. May: Peñaranda & San Isidro WL are all zero for the month; several data points were adjusted for Sasmuan WL.
6. June: San Isidro WL is zero for the month; several data points of Zaragoza WL were adjusted.
7. July: several data points of Sasmuan WL were adjusted.
8. August: Arayat WL was out-of-order starting 0500H, 28 to 1000H of September 06; WL is estimated to be in a recession trend.
9. September: Arayat RR-WL out from the start but some points filled-in as per Racc for RR & WL thru eye-fit, and data started at 1000H, 06; Zaragoza WL have abrupt ("shoot-ups") changes which were deemed erroneous and were deleted from the data series - September 3, 6-8, 10, 11, 18, 19, 22-26; October 3, 9, 13, 21, 30, 31; November 1-3. There were also some minor adjustments made with several doubtful readings. The WL data "shoot-ups" readings were mainly attributed to the malfunctioning pressure gauge sensor of the Zaragoza station (portions were deleted).
10. October: as mentioned in September data issues there were many unreliable readings ("shoot-ups") for Zaragoza WL (portions were deleted).
11. November: Peñaranda & San Isidro WL are all zero for the month. Zaragoza WL may be erroneous at 1.35m or below for long periods (deleted from 0000H, 23 until end of month).
12. December: Candaba WL was not included for almost the whole month as most data were deemed erroneous due to sensor problems; San Isidro WL is zero for the month; many caveats for Zaragoza WL as data looks unreliable due to sensor problems (deleted WL of 1.35 m or below for long periods from start of month until 0000H, 24).

The maximum monthly total values for some stations may be smaller than their 480 hours (20 days) of sliding time total. This means that the 20-day total transcends 2 succeeding months. Likewise, the 24-hour unrestricted sliding time period will be much larger than the meteorological day (fixed 8am to 8am) total.

Above table are still the latest information for PRFFWC streamgaging sites. Rating curve equations remains the latest available for now. The RCs should be updated regularly.

Note: The other WL stations were not included in the WL percent duration curves as most of their observations are either erroneous (have been deleted), mostly zero, or basically lots of gaps / breaks.
